Explain the stored procedure

User prompt

How revive orders should be processed.

Intent and applied tools

Intent: task / question. Explain the relevant stored procedure. This wording does not authorize creating, updating or reviving an order.

COMPONENT	WHAT IS APPLIED
Business tools	None. The agent returns calls = [] when the procedure can be explained from available context.
Internal services	Memory search, registry/catalog lookup, LLM planning, Postgres checkpoints and recordEpisode. Tool selection can return an empty tool list.

Applied memories

TYPE	ROLE FOR THIS PROMPT
Procedural Primary	Organization-scoped instructions for revive-order eligibility, required checks, processing sequence and exceptions - only when those rules are actually retrieved.
Semantic Optional	Relevant facts or preferences from the current organization + session. If none match, use []. A fact cannot supply a missing operating procedure.
Episodic Optional	Past steps, resolved ambiguity and outcomes may help interpretation. Verify relevance; they do not replace current Procedural rules.

Highlighted execution path

1. Parse /chat context and load the matching checkpoint.
2. Prepare the prompt and intent in one target-design LLM call.
3. Search all three memory types independently; assemble available results.
4. Select tools, resolve definitions and prepare the initial agent input.
5. agentModel explains the procedure with calls = []; compose the response.
6. Record the episode and return status: completed, sessionId, threadId and response.

Expected result and missing-memory behavior

Return an explanation grounded in the retrieved instructions. If the procedure is absent, incomplete or conflicting, state the limitation and ask for the missing rule instead of inventing processing steps.

No business write or approval interrupt. Checkpoint persistence and episode storage still occur internally.
